

nAblement Executive Brief

1. The Firm

nAblement LLC is a Pittsburgh-based technology and AI consulting firm serving businesses nationwide. We help leaders turn operational needs into working systems, with the engineering experience to assess, build, integrate, and support what we recommend.

Engineers with operating experience

As engineers who build and operate software, we understand how products and systems work beneath the surface: their capabilities, limitations, and integration requirements. That hands-on depth helps us judge what will work for your business and make better-informed recommendations.

Direct access to the team

You work with the people who assess, build, and support your systems. Our partners stay involved from discovery through deployment, keeping business priorities connected to engineering decisions. Our builds include 24/7 support, with someone available to respond promptly and begin fixing issues.

Built around your business

We have served legal, consulting, e-commerce, automotive, and asset-based businesses. We approach each business with a blank slate, respecting the workflows its owner has chosen. Every proposed solution is bespoke to how you manage your company.

Works within your existing environment

We work with your software, approved AI tools, and infrastructure. For SOC 2 controls or HIPAA requirements, we coordinate with IT and compliance teams on agreed technical and operational requirements.

2. Consulting & Software Development

A rigorous, analytical approach connects every recommendation to how your company operates and where a change can deliver value.

01	Map the work	Starting onsite with your team, we document company workflows, systems, bottlenecks, manual steps, and duplicated effort.
02	Evaluate the impact	We assess benefits, costs, and constraints. You receive a workflow map and prioritized roadmap with quoted prices, showing which steps, teams, and systems each solution affects and what would change.
03	Build & support	Implement the roadmap yourself or engage us to develop, integrate, deploy, and support the recommended systems.

Have a specific software need? We also build internal tools and full-scale products independently of an assessment.

3. Pricing

01

Consulting assessment.

The consulting assessment costs \$3,000 for two days of onsite labour and includes the roadmap. Additional onsite time is priced separately and agreed in writing before work begins.

02

Software development.

Software development is quoted by project, with milestone payments and final payment due after acceptance testing.

03

Operation and support.

A monthly fee covers hosting, usage, maintenance, and ongoing improvements for systems we operate and support. This arrangement is cancellable monthly.

Where results can be measured, part of our compensation can be tied to agreed targets for revenue growth.

4. Quality & Security Guarantees

For firms with their own IT, we work entirely within your environment, using accounts and managed devices your IT issues. Code, documents, communications, and data stay in your systems. AI runs in your cloud account or through approved tools. We do not copy production data out of your environment, and testing uses synthetic or masked data. Your IT controls and revokes our access. Nothing from the engagement remains on nAblement systems.

Software runs in your cloud account or on your infrastructure, under your control. Data is encrypted in transit and at rest. Integrations use dedicated credentials limited to the access they need, with secrets stored in a secrets manager, never in code. Each person uses a named account with multi-factor authentication, and activity is logged. You can revoke our access at any time.

We verify delivery through acceptance testing. While maintaining the software, we patch vulnerabilities in its dependencies and keep tested backups. Engineering is led by our CTO, Avyu Nagrath, whose experience includes production cloud software at The Aerospace Corporation and network security company ExtraHop. That experience informs our approach to reliable software and sensitive data.
