

High-Compliance Client-Environment Delivery Model

Nothing from the engagement exists outside your environment, so there is no vendor-side exposure for you to assess.

Our engineers work only inside your firm's systems, with only the accounts your IT issues, on devices your IT manages. Everything we build and write stays where it was made, under controls you already run: your identity provider, your access reviews, your logging, your device policy.

Systems and Access

We use only the accounts your IT issues.

Named accounts in your identity provider, MFA enforced, no shared credentials or long-lived API keys. Access covers the systems listed in the statement of work and **expires on the date written there**.

All code goes in your repositories.

Committed to your version control organization and built in your CI. Repositories are **never cloned or mirrored to nAblement systems**.

Everything we build runs in your cloud account.

Your AWS, Azure, or Google Cloud account, or on-premises, under your billing. Our engineers operate through **a scoped role your administrators grant**. Production data is never copied out; development and testing use synthetic or masked data.

Every document lives in your document system.

Interview records, field notes, workflow documentation, process maps, roadmaps, and build documentation are **authored in your SharePoint or Google Drive** from the first meeting. Communication runs in your Slack or Teams with our people as guests.

All AI runs in your cloud account.

Amazon Bedrock, Google Vertex AI, or Azure OpenAI in your tenant, or AI tooling you already approve. The model provider is **covered by the agreement you already hold with your cloud provider**. Which models we use is agreed in writing before work starts.

We work only from devices your IT issues and manages.

A virtual desktop or a laptop you issue, enrolled in your device management and subject to your endpoint policy. Personal devices are never used.

How It Works

01

Your IT provisions.

Before the first day, your IT sets up accounts, a virtual desktop or device, and access to the repositories and cloud project for the engagement. The statement of work lists each system and the access end date. Provisioning lead time is built into the schedule.

02

Our engineers work.

Interviews, workflow mapping, design, and build all happen inside the environment your IT provisioned. Your access logs cover every action from the first day.

03

Your IT revokes.

At the end date, your IT removes the accounts. We confirm in writing that nothing from the engagement remains on nAblement systems. Code, documents, and deliverables stay in your environment, where they were made.

Your IT onboards us the way it onboards any contractor, and offboards us the same way.
